

ABSTRACT

A plasma display panel (PDP) display device is provided, which can reduce the power consumption in the PDP display device without lowering of the display luminance of the PDP and has excellent reliability in suppressing rise of temperature. The PDP display device has a PDP (1) having a plurality of electrodes, a drive circuit (2) for supplying a driving waveform to the electrode, a power supply circuit (3) for supplying a power to the drive circuit, and a power control circuit (4) for adjusting an output power which can be supplied to an electrode of a plasma display panel by controlling a stop period of the power supply circuit based on emission state of the plasma display panel.
